

ABSTRACT

The invention relates to a pallet, including a base frame and four independent posts. It further includes at least one support position-limiting assembly arranged at a predetermined position on the base frame, the support position-limiting assembly includes: a U-shaped bending component, having a supporting surface and two opposite position-limiting surfaces bended and extending along two opposite edges of the supporting surface, at least a group of position-limiting holes being arranged in opposition at the predetermined positions on the two opposite position-limiting surface, and positioning and connecting components fitted with the position-limiting holes. The invention can position the cargo effectively, and ensure a safety in cargo transportation and an efficient and rapid operation.
